

Estrex solar Malaysia

Where did the eTrex solar go?

On a partly cloudy afternoon, we clipped the eTrex Solar to the top of a backpack and headed onto the wooded trails of Redstone Quarry in Conway, NH. Thick with oaks and maples, we still had reasonably good exposure to the sky with most of the leaves fallen. The first unit activity we noticed was the constantly-changing solar intensity reading.

Is eTrex solar a good idea for backpackers?

As the name suggests, the new eTrex Solar is novel for its ability to run seemingly forever in sunny conditions. While this tech might not be a huge boon for casual backpackers in its current form, it's an impressive indication of where handheld GPS devices and satellite communicators might be headed in the near future.

Is eTrex solar the future of handheld devices?

For us, the answer is yes. Not because it solves a festering problem, but because the eTrex Solar's sensitivity and minimal energy consumption is likely the tip of the spear for the future of handhelds and other devices. Undoubtedly, batteries will continue to shrink to the point where wafer-thin devices will become a reality.

Do we really need solar charging for the eTrex se?

The base battery life is good for 200 hours in GPS-only mode, or 100 with GNSS and multi-band tracking activated. That's more than enough for most backpackers on extended trips. So the question arises: do we really need solar charging for an additional \$100 compared to the basic eTrex SE model? For us, the answer is yes.

Does Garmin's new eTrex solar have new features?

However, Garmin's new eTrex Solar doesn't include a bundle of new features, as is often the case with a model release. As the name suggests, the new eTrex Solar is novel for its ability to run seemingly forever in sunny conditions.

Should you buy a Garmin eTrex solar?

And for folks headed out on extended trips without access to an outlet or those who want to use GNSS and multi-band tracking with wild abandon, the eTrex Solar is already a no-brainer. Garmin's eTrex Solar aims to solve a problem that plagues handheld GPS units: battery life.
