

Iran power factors

What is Iran's main energy source?

In 2007, Natural gas was the main energy source in Iran, comprising over 55 percent of energy needs, with oil and hydroelectricity accounting for 42 and 2 percent respectively. The region's energy need will increase by 26.8 percent until 2012.

How much energy does Iran use a thermal power plant?

Currently, thermal power plants supply 90% of Iran's electricity by burning natural gas, diesel, and mazut. These power plants consume over 30% of the gas produced in Iran but have low efficiency, with the best-case scenario being a 40% efficiency rate, meaning they waste 60% of the gas delivered.

How efficient are power plants in Iran?

The efficiency of power plants in Iran is remarkably low, ranging from 20% to 40%, and sometimes even less than 20%. This is despite the fact that power plants in Iran receive fuel at almost no cost. According to Clause 14 of the regime's budget law for 1401 [2022-2023], the price of gas delivered to power plants was equivalent to 100 rials.

Why is Iran in a energy crisis?

Although Iran has one of the biggest supplies of natural gas and crude oil in the world, it is in a full-blown energy crisis that can be attributed to years of sanctions, mismanagement, aging infrastructure, wasteful consumption -- and targeted attacks by Israel.

Why is Iran getting so much electricity in 2022?

According to a 2022 U.S. Energy Information Administration (EIA) report, Iran has experienced escalating electricity demand driven by factors including illegal cryptocurrency mining, population growth, highly subsidized electricity prices, and fuel supply shortages.

How much electricity can Iran produce?

It has been estimated that Iran has the potential to produce at least 6,150 MWh of electricity by wave power from its coastline on Persian Gulf alone. Iran is also experimenting with electricity generation from organic wastes and plans to build power plants using sewage and organic waste of domestic and industrial origin as fuel.

Experts have identified several factors contributing to the current electricity shortfall, including inadequate investment in the power sector, a lack of power plant development, an aging production and transmission infrastructure, and energy prices that have exacerbated the supply and demand imbalance.

Indeed, according to Ali Nikbakht, Chairman of the Board of Directors of the Iran Power Plants Association, while the total nominal capacity of Iran's power plants is over ...
