What are advanced energy storage materials for direct solar desalination?

Advanced energy storage materials for direct solar desalination are discussed. Recent studies on nanomaterials, nanofluids, nanophase change materials, phase change materials with porous materials, and heat pipes are presented. A general cost analysis and environmental evaluation of different phase change materials have been made.

Can nanomaterials improve solar desalination systems?

In this present study, a focus on energy materials including nanomaterials, nanofluids, nanoparticles-based phase change materials (PCMs), composite PCMs, PCMs with porous materials, and PCMs with heat pipes have been investigated with regard to their ability to improve solar desalination systems.

Do advanced energy storage materials improve solar still water productivity?

The review's outcomes identify that advanced energy storage materials substantially influence the enhancement of solar still productivity as compared to conventional solar stills. The results indicate that the application of thermosyphon heat pipes with PCM more than doubles the performance of solar still water productivity.

Can energy storage materials improve the freshwater productivity of solar desalination?

Advanced energy storage materials, such as nanoparticles, nano-enhanced phase change materials and phase change materials, can enhance the freshwater productivity of solar desalination. To date, most related research has been performed to enhance water productivity using energy storage materials.

What is nano-PCM in solar desalination?

Nano-PCM in solar desalination Phase change materials (PCMs) act as heat storage materials in solar energy applications, where by raising their thermal properties, the performance of solar energy applications during low solar radiation increases.

How can a solar desalination system improve water productivity?

The receiving waste thermal energy of the PV on energy storage materials can store a high amount of thermal energy on it. Coupling energy storage materials with energy applications for storing the waste thermal energy can increase the water productivity of the solar desalination system.
