What is a superconducting magnet?

A superconducting magnet is an electromagnet made from coils of superconducting wire. They must be cooled to cryogenic temperatures during operation. In its superconducting state the wire has no electrical resistance and therefore can conduct much larger electric currents than ordinary wire, creating intense magnetic fields.

How does a superconductor repel a magnet?

This current effectively forms an electromagnet that repels the magnet. Superconductivity is a set of physical properties observed in superconductors: materials where electrical resistance vanishes and magnetic fields are expelled from the material.

What is the maximum magnetic field achievable in a superconducting magnet?

The maximal magnetic field achievable in a superconducting magnet is limited by the field at which the winding material ceases to be superconducting, its "critical field",  $H_c$ , which for type-II superconductors is its upper critical field.

What is superconducting magnetic energy storage (SMES)?

Superconducting magnetic energy storage (SMES) systems store energy in the magnetic field created by the flow of direct current in a superconducting coil that has been cryogenically cooled to a temperature below its superconducting critical temperature. This use of superconducting coils to store magnetic energy was invented by M. Ferrier in 1970.

Why are superconducting materials used in winding electromagnets?

Below  $T_c$ , superconducting materials have the unique ability to transport large direct current (DC) without any electrical dissipation. Therefore, superconducting materials are widely used for winding electromagnets to produce strong magnetic fields with low power consumption.

What are the basics of superconductivity?

In this paper, I described the basics of superconductivity, introduced the superconducting wires used in magnets, and explained cryogenic heat insulation technology, superconducting connection technology, and design method for a highly uniform magnetic field as technologies used in superconducting magnets.
