

Which organ can store phlegm

Where does phlegm come from?

Phlegm comes from the respiratory system, specifically produced by the mucous membranes lining the airways, including the throat, bronchi, and lungs. These membranes secrete mucus as a protective response to irritants, infections, or allergens.

What is the difference between phlegm and mucus?

Mucus is a slippery substance produced by mucous membranes throughout the body, including the respiratory system, to trap and eliminate irritants. Phlegm specifically refers to the mucus produced by the respiratory system, especially when it's thick and associated with an infection or disease.

What is phlegm & why is it important?

Phlegm is a thick, sticky mucus produced by the respiratory system, primarily during illness. It serves as a defense mechanism, trapping pathogens and irritants, and aiding in their removal from the body. Phlegm's color and consistency can vary, providing clues about one's health and the nature of their respiratory issues.

What does phlegm mean?

Phlegm (/ˈflem /; Ancient Greek: φlegma, "inflammation"; "humour caused by heat") is mucus produced by the respiratory system, excluding that produced by the throat nasal passages. It often refers to respiratory mucus expelled by coughing, otherwise known as sputum.

Can phlegm be swallowed?

Yes, it is generally OK to swallow mucus or phlegm. When you swallow it, the stomach acid neutralizes any potentially harmful pathogens it contains. However, if you're producing excessive amounts, spitting it out can sometimes feel more comfortable and can prevent stomach discomfort in some cases. Does Phlegm Look Like Mucus?

Why is phlegm thicker than usual mucus?

Phlegm is thicker than normal mucus because it's helping fight an infection in your lower respiratory tract. It's usually coughed up and you might wonder, should you swallow phlegm or spit it out?
