

What is the control strategy for wind and storage joint primary frequency regulation?

Wind and storage joint primary frequency regulation control strategy Based on the above analysis of the virtual inertia and battery droop control of the DFIG, this paper proposes a control strategy for the primary frequency regulation of the wind and storage joint participation system. The control block diagram is shown in Fig. 5. Fig. 5.

Do wind turbines and energy storage participate in frequency regulation?

In the first strategy, both wind turbines and energy storage do not participate in frequency regulation. The second strategy is that the wind turbine adopts variable coefficient control. The third strategy is that both the wind turbine and the energy storage system are controlled with constant coefficients.

How do wind storage systems regulate the frequency of the power grid?

When the wind storage system participates in the frequency regulation of the power grid, its control effect needs to meet the requirements of the three indicators of AGC response time, regulation rate, and regulation accuracy.

Can a wind-storage combined system support frequency stability?

To enhance the frequency stability support ability of such wind-storage combined systems, this paper proposes a virtual synchronous control strategy for a wind-storage combined system considering the battery state of charge (SOC).

Can a wind-storage combined system use high-SoC batteries efficiently?

To solve such problem, this paper proposes the frequency control strategy of a wind-storage combined system considering the different battery storage system's SOC's, such that the wind-storage combined system can use the frequency support ability of the wind power and high-SOC batteries efficiently.

What happens if wind and storage does not participate in a frequency regulation?

When the wind and storage does not participate in a frequency regulation, the depth of the system frequency drop is the largest; after the wind and storage participates in a frequency regulation, the maximum value of the system frequency drop is significantly reduced.

In view of the above problems, a control strategy of wind and storage participating in the primary frequency regulation of the power system is proposed considering the energy storage recovery strategy.
